- PSUs and sustainability

We are an amazingly interconnected world. This happened millions of years before modern trade and tech made the world flat and interconnected. Interconnected organic and inorganic microsystems interact to form a complex system. The complexity of system grows with the increasing understanding of the interconnectedness. Different but related terms - Chaos Theory, Butterfly Effect, Telecoupling, Gaia Hypothesis – are used to express this.

A policy decision, a natural occurrence, a social event, a technology application, may cascade events with effects elsewhere. We are beginning to realise the strength of interconnectedness and interactions between microsystems and impacts thereof. Big problems like those we are faced with require big solutions, based on a systems approach.

Scientific understanding of complex interactions between microsystems and a systems approach are required to build the regenerative capacity of Earth to sustain life. Development and deployment of solutions, including data analytics, artificial intelligence, biomaterials, genetics, must identify their impact on microsystems and be based on systems thinking.

CII's 14th Sustainability Summit is designed to bring to fore science-based (natural sciences, social sciences and philosophy) understanding, examples of systems approach in policy making, product design, and business reengineering, and sustainability solutions that provide intergenerational justice.
